As our road networks become more crowded, the use of tunnels and underpasses is expanding, to improve traffic flow, and also to protect local environments from increased traffic exposure.

Within tunnels, where maintenance access can be limited, and where corrosive atmospheric conditions are common, reliable performance of the lighting system is critical, as is the need for absolute minimum maintenance operational requirements.

The objectives of tunnel lighting

The aims of tunnel lighting are:

- Firstly, to allow traffic to enter, pass through and exit the enclosed section safely
- Secondly, to do so without impeding the through-flow of traffic.

These aims are achieved by the adequate illumination of the tunnel interior, which allows drivers to quickly adjust to the light within, identify possible obstacles, and negotiate their passage without reducing speed.

These requirements apply during the day when the contrast between outside and inside is significant and at night when it is less, but reversed.

Tunnel lighting criteria

Good tunnel lighting allows users to enter, pass through and exit the enclosed section safely and comfortably

The 5 zones of tunnel lighting

CIE guidance (CIE 88-1990), and UK standard (BS5489-2:2003) state that the amount of light required within a tunnel is dependent on the level of light outside and on the point inside the tunnel at which visual adaptation of the user must occur.

When planning the lighting of a tunnel, there are 5 key areas to consider:

1 Access zone

Not within the tunnel itself, this is the stretch of road leading to its entrance.

From this zone, drivers must be able to see into the tunnel in order to detect possible obstacles and to drive into the tunnel without reducing speed.

The driver's capacity to adapt in the access zone governs the

lighting level in the next part of the tunnel. One of the methods used by CIE to calculate visual adaptation is the L_{20} method, which considers the average luminance from environment, sky and road in a visual cone of 20° , centred on the line of sight of the driver from the beginning of the access zone (see below).

2 Threshold zone

This zone is equal in length to the 'stopping distance'. In the first part of this zone, the required luminance must remain constant and is linked to the outside luminance (L_{20}) and traffic conditions. At the end of the zone, the luminance level provided can be quickly reduced to 40% of the initial value.

3 Transition zone

Over the distance of the transition zone, luminance is reduced progressively to reach

the level required in the interior zone. The reduction stages must not exceed a ratio of 1:3 as they are linked to the capacity of the human eye to adapt to the environment and, thus, time-related. The end of the transition zone is reached when the luminance is equal to 3 times the interior level.

4 Interior zone

This is the area between transition and exit zones, often the longest stretch of tunnel. Lighting levels are linked to the speed and density of traffic, as outlined in the table below.

Luminance to be maintained in interior zone

Extra urban, low traffic, low speed (<70km/h)	1.5 to 3cd/m ²
Extra urban, high traffic and/or speed (>70km/h)	2 to 6cd/m ²
Highway	4 to 10cd/m ²
Urban	4 to 10cd/m ²

5 Exit zone

The part of the tunnel between the interior zone and the portal. In this zone, during the day time, the vision of a driver approaching the exit is influenced by brightness outside the tunnel.

The human eye can adapt itself almost instantly from low to high light levels, thus the processes mentioned when entering the tunnel are not reversed. However, reinforced lighting may be required in some cases where contrast is needed in front of or behind the driver when the exit is not visible, or when the exit acts as entrance in case of emergency or maintenance works where part of a twin tunnel may be closed. The length is a maximum 50m and the light level 5 times the interior zone level.

Visual adjustment

The visual adjustment from high luminance to low luminance while driving is not instantaneous. This is because of two disability phenomena:

1. *Spatial adaptation*: the large difference in luminance between the outside and the inside of the tunnel will impede the vision of the driver when he is at the adaptation point ('A', opposite). The "Black Hole" phenomenon engenders a feeling of discomfort and insecurity.

2. *Temporal adaptation*: human eyes need more time to adapt from brightness to darkness than the reverse. During this period of adaptation, the distance travelled is a critical factor.

Definitions

Access zone luminance L_{20}

The average value of the luminance in a 20° cone of the driver's visual field from the access zone and centred on the tunnel entrance.

Contrast revealing coefficient qc

The ratio between the luminance at the road surface and the vertical illuminance E_v at a specific location in the tunnel $qc + L/E_v$. The method of tunnel lighting may be defined in terms of the contrast ratio in two ways: symmetric lighting and counterbeam lighting (see pages 6 - 7).

Entrance and exit portals

The entrance portal of the tunnel is the part of the tunnel construction that corresponds to the beginning of the covered part of the tunnel, or - when open sun-screens are used - to the beginning of the sun-screens. The exit portal corresponds to the end of the covered part of the tunnel, or - when open sun-screens are used - to the end of the sun-screens.

Exit zone

The exit zone is the part of the tunnel where, during the daytime, the vision of a driver approaching the exit is predominately influenced by the brightness outside the

tunnel. The exit zone begins at the end of the interior zone. It ends at the tunnel's exit portal.

Interior zone luminance (L_{in})

The average luminance in the interior zone which constitutes the background field against which objects will be visible to users.

Parting zone

The parting zone is the first part of the open road directly after the exit. The parting zone is not a part of the tunnel but it is closely related to the tunnel lighting. It is advised that the length of the parting zone equals two times the stopping distance. A length of more than 200m is not necessary.

Stopping point (SP)

The position within the access zone on the approach road at a distance equal to the stopping distance (SD) from the tunnel entrance.

Stopping distance (SD)

The theoretical forward distance required by a driver at a given speed in order to stop when faced with an unexpected hazard on the carriageway.

This takes into account perception and reaction time as well as road surface.

Threshold zone luminance (L_{th})

The average luminance in the threshold zone which constitutes the background field against which objects will be visible to drivers in the access zone between the stopping point and adaptation point.

Traffic flow

The number of vehicles passing a specific point in a stated time in stated direction(s). In tunnel design, peak hour traffic, vehicles per hour per lane, will be used.

Transition zone luminance (L_{tr})

The average luminance in the transition zone which constitutes the background field against which objects will be visible to drivers.

Veiling luminance

The overall luminance veil consisting of the contribution of the transient adaptation and stray light from optical media, from the atmosphere and from the vehicle windscreen.

Types of tunnel lighting

Tunnel road lighting must provide comfort and safety and maximise the visual performance of users.

Symmetrical and asymmetrical lighting

Used generally for transition and interior zones for long tunnels, and in short tunnels, or low speed tunnels for all zones.

Asymmetrical lighting can also be a means of reinforcing the luminance level in one way tunnels.

Asymmetric counter beam lighting

To reinforce the luminance level and at the same time accentuate the negative contrast of potential obstacles. Counter beam lighting is achieved with asymmetrical light distribution facing into the traffic flow, both in the direction of the on coming driver and in the run of the road. The beam stops sharply at the vertical plane passing through the luminaire. No light is directed with the flow of traffic. This generates negative contrast and enhances visual adaptation.

Other factors

As well as the above, further factors must be taken into consideration when preparing tunnel lighting. These include the shape of the portal, type and density of traffic, traffic signage, contribution of wall luminance, orientation of tunnel, and many others. National, European and International legislation and guidance sets out minimum standards for tunnel lighting.

Relevant legislation

CEN TC 169/WG 6

Technical Report Final Draft 08.2001.

CIE 88-1990

Guide for the lighting of roads, tunnels and underpasses.

BS 5489-2: 2003

Roadlighting Part 2: Code of Practice for the design of road lighting.

Day time lighting of tunnels for different lengths

(CIE-Guide for the lighting of tunnels and underpasses)

When lighting a tunnel, its length, geometry and immediate environment must be taken into account as well as traffic densities. Differing light levels are set for each project, according to the governing standards summarised below:

Length of tunnel	125m															
Is exit fully visible when viewed from stopping distance in front of tunnel?	-	yes	yes	no	no	no	yes	yes	no	no	no	no	no	-		
Is daylight penetration good or poor?	-	-	-	good	good	poor	-	-	good	good	good	poor	-			
Is wall reflectance high (>0.4) or low (<0.2)?	-	-	-	high	low	-	-	-	high	high	low	-	-			
Is traffic heavy (or does it include cyclists or pedestrians) or light?	-	light	heavy	light	-	-	light	heavy	light	heavy	-	-	-			
Lighting required	●	●	●	●	●	●	●	●	●	●	●	●	●			

● No day time lighting

● 50% of normal threshold zone lighting level

● normal threshold zone lighting level

Typical tunnel lighting arrangements

The table below outlines some of the mounting options available and their respective advantages/disadvantages

	Mounting constraint	Arrangement type	Advantages	Disadvantages	Tunnel profile
Ceiling mounting	Enough spacing above legal and protection minimum height	Above road on several rows 	- best utilisation factor for luminaires - glare limited	- luminaires concealed by signs 	- Arched type with or without fan tubes - Framed type with or without fan tubes
		1 row above road 	- less investment and maintenance	- heavy fixings - closure of carriageway required	
Wall mounting	Not enough spacing above legal and protection minimum height	Twin opposite 	- easier access to luminaires - 1 lane only need be closed	- utilisation factor downgraded - high glare	- Arched type with fan tubes - Framed type with or without fan tubes
		Single sided 	- less investment and maintenance	- beware trucks blocking light 	

Ceiling mounting, transverse symmetrical lighting

Ceiling mounting, longitudinal symmetrical lighting

Wall mounting: asymmetrical lighting

Ceiling mounting: asymmetrical counter beam lighting

Tunnel lighting must allow vehicles to enter, pass through and exit the enclosed section safely without impeding the through-flow of traffic.

Thorn expertise - creating the best tunnel lighting and visibility

Our development programmes employ specialised software to help develop highly engineered optics, to optimise lighting systems, and to allow our lighting engineers to provide maximum safety and comfort for tunnel users.

Thorn visibility modelling software indicates the 'real' visibility of objects as perceived by the tunnel user, as well as the mathematically calculated levels required to meet the relevant standards.

Lighting a tunnel is a complex and specialised task. Thorn has developed dedicated lighting systems and services to assist planners from concept to implementation, management and servicing.

While luminance levels are used for accurate theoretical assessment, in practice, illuminance is more often used. Thorn assessment studies, therefore, are executed using luminance values, with results presented as illuminance values.

It is commonly accepted in road lighting that, even with the most accurate calculations and modelling to give the lighting levels required by the most stringent standards, there is a substantial difference between what the mathematical lighting conditions are, and what each individual driver subjectively sees in reality. This is especially true for tunnel lighting, where such sharp contrasts in light levels prevail.

Thorn in-house visibility modelling software

At Thorn we have addressed this problem head on. Continuous research and development has led to more sophisticated and detailed understanding of lighting and its effects on vision. Along with rapid advances in IT, this has allowed us to develop dedicated in-house software which combines mathematical models of physiological stimuli with conventional lighting modelling parameters to generate results which are, visually, as well as mathematically, accurate beyond alternative visual modelling techniques.

Thanks to an impressive number of variables, our software is a unique and accurate tool. It verifies the ability of a given lighting system to meet the visual criteria set by all national and international standards regarding detection of obstacles on the road, within the allocated time.

Thorn software measures anticipated light falling on a series of facets, in order to calculate luminance gradients on target objects.

Helping lighting designers and tunnel users

Taking into account criteria from the tunnel exterior and interior, the software generates a table of visibility levels (VL) that shows the extreme influence of daylight on the values of VL on targets in the entrance and threshold zones of the tunnel.

Experiments demonstrate that the minimum Level of Visibility (VL) should have a value equal to or greater than 7 to ensure detection of planar or spherical targets. Though in Thorn's current calculations, the target size may not exactly represent a potential obstacle in a tunnel, they show the behaviour of light on real, multifaceted objects whose diffuse reflectance can be modified and therefore they represent a real visual scenario for tunnel users.

The design of the lighting system needed for a tunnel is the job of experienced designers who define the scheme, the choice of the lighting system, the type and number of luminaires and their appropriate light distribution. Thorn's visibility software provides invaluable new input into the design of optics for tunnel fittings making it easier for designers to create lighting systems and light distribution schemes for tunnels that maximise the visual performance and comfort of users.

Controlling tunnel lighting

For the critical approach areas and interiors of tunnels, close control of light levels is essential. Levels of light outside the tunnel, time of day, speed and density of traffic, all influence the lighting requirements within. We offer fully integrated control systems to meet this demand.

Thorn tunnel lighting control

Thorn offers a comprehensive range of tunnel luminaires paralleled by an advanced, highly innovative control system which is adapted to tunnel applications:

- From basic to technologically advanced, highly innovative systems
- Fluorescent and HID lamp solutions
- Integration of up to date gear options
- Easy to install and operate systems
- Cost efficient systems
- Optimisation of safety conditions

From simple standard on/off operation, to complex step dimming or security networks, Thorn provides the best professional assistance in advising and offering the right system to meet the requirement.

DSI and DALI controls for fluorescent lamps

- Digital dimming for HF gears operating fluorescent lamps
- Unique cabling

Benefits

- Group management
- Extendible installation
- Capability to interface DSI and DALI controls with analogue 1 - 10V command on existing installations
- Ease of installation thanks to non-polarised command wires
- Enhanced safety of operation as signals not subjected to interference

Power switch controls for HID lamps

- Manual or automated power reduction for HS lamps

Benefits

- Ease of installation as integrated in control gear
- Cost efficient options
- Suitable for threshold and central zones

Power line controls for HID lamps

- Automated but re-programmable controls
- Detailed feedback on supply, status logs, dates, times and burning hours

Benefits

- Group management
- Individual control and monitoring
- Upgradable installation
- Possible remote access option via central server
- Capacity to interface the system with data base
- Low installation and operation costs
- Reduced maintenance schedules

Tough luminaires for tough environments

Salts, sulphur pollutants, exhaust fumes consisting of hydrocarbons and organics in tunnels can result in the presence of sulphuric or nitric acid.

Water ingress protection testing

Impact resistance testing

Optic design

Photometric measurement

Assembly and quality control

Corrosion testing

Gear testing

In any given tunnel environment, there may be moisture, salts, sulphur pollutants, exhaust fumes consisting of hydrocarbons and organics, fuels and oils, soot, dust and strong washing detergents from jet cleaning.

Furthermore, analysis of water samples identifies the following compounds: toluene, sulphate, zinc, sulphide, molybdenum, cadmium, beryllium and mercury.

Clearly some of these compounds are the result of corrosion products. Sodium chloride and other chlorides used for road de-icing can add to the chemical cocktail.

Depending on the region (marine atmospheres or long mountain tunnels, for instance), these chemical combinations can result in the presence of sulphuric or nitric acid!

Luminaires installed in such environments can get rapidly contaminated. There is no rainfall to wash away the deposits that settle, condense or get splashed on their surfaces. Regular maintenance can alleviate the conditions, but, in general, this is usually impractical due to the logistics of access, tunnel closure and cost.

In such hostile environments, it is vital to choose designs and

materials that create luminaires whose function and effectiveness will not be compromised.

Thorn's tunnel luminaire ranges are designed to withstand 'tunnel life' and are made of the highest quality materials, integrating the latest developments in terms of ingress protection, shock and vibration resistance as well as a range of features to facilitate ease of access and maintenance.

Titan

- Sturdy construction
- Quick change gear tray design
- Shallow profile
- Set of attachments

Applications

Ideal for lighting service or emergency areas. Suitable for traffic, pedestrian and train tunnels.

Equipment

Glare hoods, wire guards, pole mounting brackets.

Lamps

Max. 70W HSE-I (SE/I) High pressure sodium internal ignitor.
Cap: E27
Min. 70W/Max. 100W HST (ST) High pressure sodium.
Cap: E27/E40
Max. 110W HSE (SE) High pressure sodium.
Cap: E27
Min. 70W/Max. 100W HIE (ME) Metal halide.

Min. 2x18W/Max. 2x26W TC-D (FSQ) Compact fluorescent.
Cap: G 24d-2/G: 24d-3
Max. 1x200W A80/m (IAA-80/m) Incandescent.
Cap: E27

Materials/Finish

Housing - LM6 marine grade aluminium powder coat finish
Hinges, locks and fixings - stainless steel
Enclosure - borosilicate glass lens.

Standards

Class 1 Electrical
⚡ ⚡ IP65/ ⚡ IP66

Dimensions

370x254x179mm

Sturdy one piece bulkhead

Titan DIP with wire guard

Titan with glare hood

Emergency version of Titan

- Dedicated to FDH 49W lamps
- 4 long closing plates
- Slim lightweight profile
- Axial or lateral surface mounting

Applications

Symmetrical and asymmetric light distribution. Suitable for urban tunnels, underpasses and galleries.

Equipment

Louvers, dimming devices, mounting brackets supplied to meet project requirements.

Lamps

Max. 2x49W T16 (FDH) Linear fluorescent. Cap: G5

Materials/Finish

Housing - powder coated galvanised steel with anodised aluminium locking plates, or stainless steel with anodised powder coated locking bars.
Enclosure - 4mm thick toughened flat glass.
Reflector in 99.8% pure aluminium.

Case study 2

Katerini Tunnel, Greece

The national motorway, when completed, will run across Greece from Patras to Evzoni, via Athens and Thessaloniki. Three tunnels requiring a full tunnel lighting system are constructed in the Katerini area.

Tunnel description

Long motorway tunnel.
2 tubes - 3 lanes carriageway.

Technical data

Length: Right tube - 1100m
Left tube - 1100m

Speed limit: 100 km/h

Traffic flow: medium less than 1,000 vehicles per hour.

Stopping distance (SD):
180m on wet road.

Determination of L_{th} :

Right tube entrance:

$L_{20} = 3.500\text{cd/m}^2$

Left tube entrance:

$L_{20} = 5.000\text{cd/m}^2$

Lighting system: counterbeam and symmetric

Type of fitting: counterbeam and symmetric fittings

$k = L_{th}/L_{20} = 0.072$ for counter beam lighting system and for SD = 180m

Maintenance factor: 0.70

Right tube details

Threshold zone

L_{th} to be maintained: $L_{20} \times k = 252\text{cd/m}^2$

Length = 180m = SD

Threshold zone 1: 132m $L_{th} = 252\text{cd/m}^2$ maintained

Threshold zone 2: 48m $L_{th} = 176\text{cd/m}^2$ maintained

Transition zone

The end of the transition zone is reached when the luminance is 3 times the interior luminance level

As the traffic flow is medium, the maintained level in the interior zone shall be 10cd/m^2 or 4% of the threshold zone level.
Length = 220m = given by CIE curve

Transition zone 1:

30m $L_{tr} = 100\text{cd/m}^2$ maintained

Transition zone 2:

55m $L_{th} = 58\text{cd/m}^2$ maintained

Transition zone 3:

135m $L_{th} = 28\text{cd/m}^2$ maintained

Interior zone

Length = 524m

$L_{in} = 10\text{cd/m}^2$ maintained

Exit zone

Luminance of the exit zone is equal to 5 times the interior zone luminance

Length = 180m

$L_{ex} = 50\text{cd/m}^2$ maintained

Lighting fitting arrangement

Day time

Threshold and transition zones are lit by counter beam fittings. Interior and exit zones are lit by symmetric fittings.

Zones	Length (m)	No of fittings per tube	Day time			
			Counter beam 400W		Symmetric 150W	
Threshold 1	180	276	276			
Transition	220	104	40	64		
Interior right	524	256			196*	60
Exit	180	86			30*	56

*common to day time and night time

Night time

All zones are lit by symmetric fittings.

Zones	Length (m)	No of fittings per tube	Night time			
			Counter beam 400W		Symmetric 150W	
Threshold 1	180	32			32	
Transition	220	36			36	
Interior right	524	88			88	
Exit	180	30			30

Thorn Lighting is constantly developing and improving its products. All descriptions, illustrations, drawings and specifications in this publication present only general particulars and shall not form part of any contract. The right is reserved to change specifications without prior notification or public announcement. All goods supplied by the company are supplied subject to the company's General Conditions of Sale, a copy of which is available on request. All measurements are in millimetres and weights in kilograms unless otherwise stated.
